

Optimize your smart city journey

Our smart city expertise and assessment tool will help optimize your smart city and technology planning efforts.

“

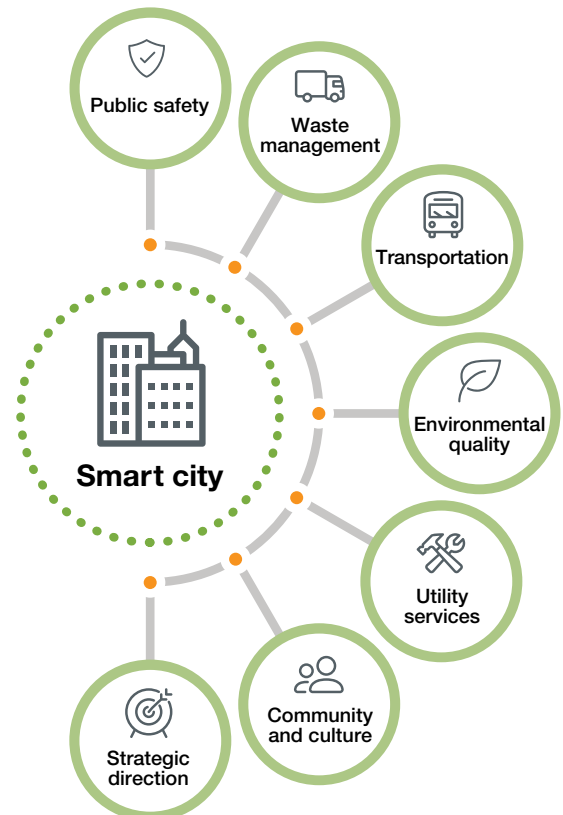

Using the E Source Smart City Assessment tool, we were able to get anonymous input from our staff, which helped us to identify opportunities to optimize our technology and communications, recognize the most cost-effective investment in our community, and enhance our internal processes for future-proof solutions.

—Andrew Halbrook,
Public Works Utilities Manager,
City of Ruston

”

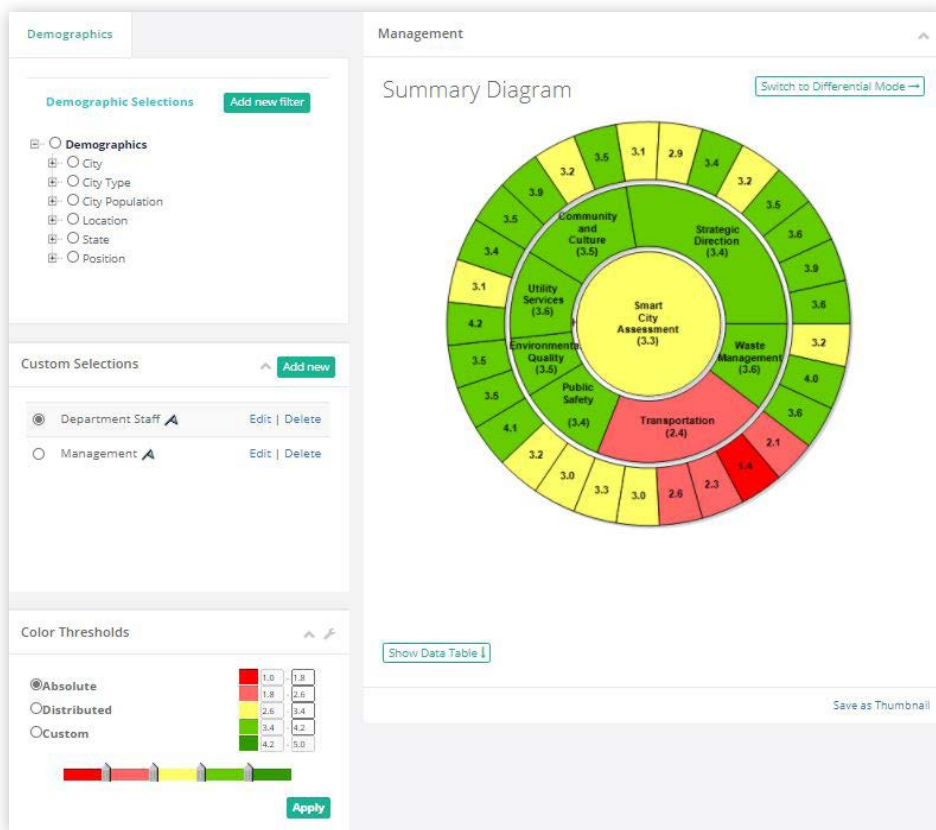

Cities across the US and Canada are recognizing the benefits of becoming a smart city, but many aren't aware of the tools that are available to help them succeed. The time and effort needed to get feedback from key stakeholders across departments, coupled with an overwhelming amount of technology options on the market, results in many cities finding themselves at a standstill. That's why we designed the E Source Smart City Assessment tool. It's a highly effective way for cities to get the insights they need to ensure a successful smart city project.

E Source helps cities assess their technological and organizational maturity in seven key areas to prioritize future investments.

We've worked with cities and utilities across the US and abroad as they evaluate the technological and operational changes needed to modernize. Our deep roots in the utility and municipal sectors, combined with our advanced data science modeling capabilities, enables you to accurately predict the likelihood of your project's success based on the unique demographics of your region. This allows you to focus on the programs that will be most effective for your citizens.

From defining your smart city and digitalization vision and developing business cases for new technology investments to designing requirements and acceptance criteria and finding funds, E Source can assist with your smart city journey.

Our web-based tool compiles survey data from numerous teams and departments across your city. Our unique software engine interprets and presents this data using an array of user-friendly charts and graphs, enabling cities to prioritize investments, support continuous improvement efforts, and benchmark their efforts against those of other leading cities.
